PROJECT OVERVIEW

Project Description

NAVSPOT Travels and Tours is a simple, user-friendly mobile application designed to help users discover popular tourist destinations across the Philippines. The app serves as a digital travel guide, showcasing beautiful places such as Boracay Island, Chocolate Hills, Mayon Volcano, Banaue Rice Terraces, El Nido, and Siargao Island. Users can create a personal account, log in securely, and browse through curated travel spots with brief descriptions and location details. The application aims to promote local tourism and provide accessible travel information to anyone with a mobile device.

Problem Statement

Many travelers, especially students and local tourists, lack a simple and centralized mobile platform where they can quickly view basic information about Philippine destinations without overwhelming features or complicated navigation. Existing travel applications are often too complex, require internet-heavy content loading, or focus heavily on booking rather than simple discovery. There is a need for a lightweight app that focuses on presenting clear, concise, and accessible travel information to users.

Target Users

- Students looking for quick travel references and destination ideas
- Local tourists planning trips within the Philippines
- First-time travelers seeking basic information about popular destinations
- General users who appreciate a clean, simple, and easy-to-use mobile interface

Proposed Solution

The NAVSPOT Travels and Tours mobile application offers a straightforward solution by providing essential travel destination information through a clean, minimal interface. Users can register an account, log in securely, and immediately access a list of top tourist spots with short descriptions and their respective locations. The design prioritizes ease of use, fast navigation, and readability, ensuring that users can find the information they need without unnecessary complexity.

OBJECTIVES, SCOPE AND FEATURES

General Objective

To design and develop a simple mobile application that serves as a digital travel guide for Philippine destinations, incorporating basic user authentication and an intuitive user interface.

Specific Objectives

- To create a secure registration and login system that allows users to access the application.
- To display key tourist destinations with clear descriptions and location information.
- To implement a clean and responsive user interface that works well on standard mobile devices.

- To provide a lightweight application that loads quickly and is easy to navigate.
- To practice the fundamentals of mobile application development, user interface design, and basic flow implementation.

Scope and Limitations

Scope:

- User registration and login system
- Display of six (6) pre-selected Philippine tourist destinations
- Basic user profile display showing the logged-in user's name
- Logout functionality
- Simple and consistent design across all screens

Limitations:

- The application does not include online booking or reservation systems
- No search or filter functions for destinations
- No map integration or real-time navigation
- Content is static and cannot be updated by users within the app
- No internet database; user data is stored locally for demonstration purposes only

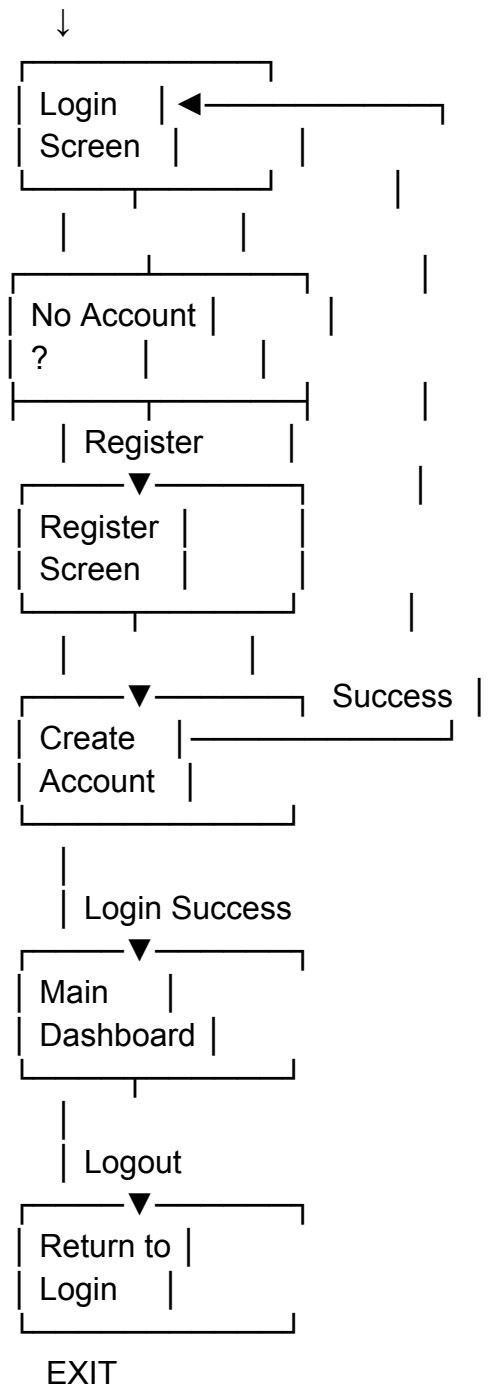

Major Features

Feature Description
User Registration New users can create an account using their name, email, and password
User Login Registered users can securely access the app using their credentials
Destination List Displays featured tourist spots with name, location, and short description
Personalized Welcome Shows the logged-in user's name on the dashboard screen
Logout Function Users can securely end their session and return to the login screen

SYSTEM DESIGN

Application Architecture / Flow Diagram

START

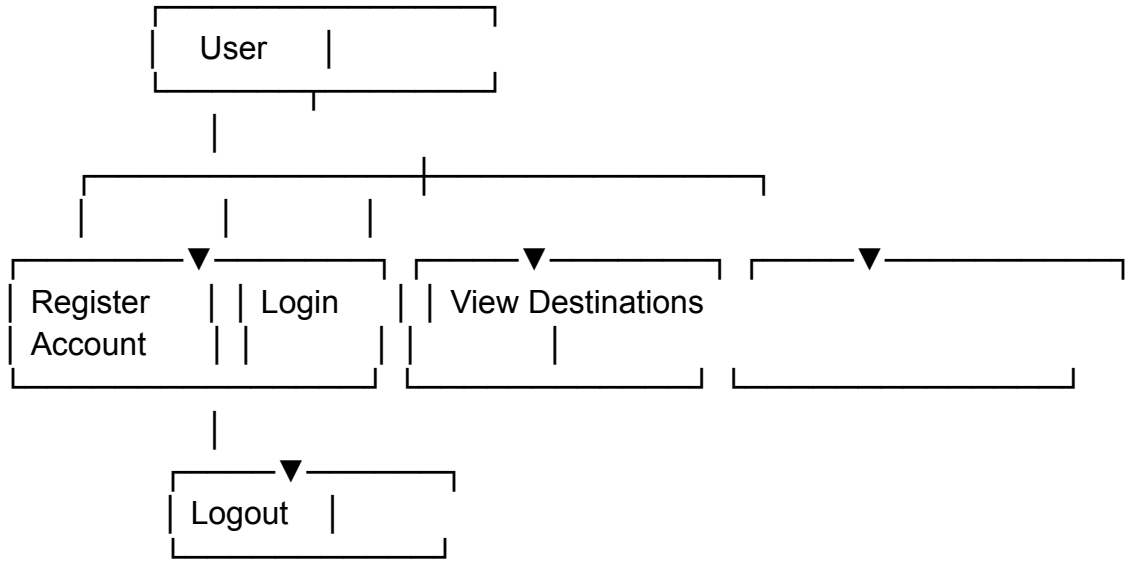

Flow Description:

1. When the application opens, the user is presented with the Login Screen.
2. If the user does not have an account, they can tap "Register" to go to the Create Account Screen.

3. After completing registration, the user is directed back to the Login Screen to sign in.
4. Upon successful login, the user lands on the Main Dashboard, which displays the list of featured destinations and a personalized welcome message.
5. The user may tap Logout to end their session and return to the Login Screen.

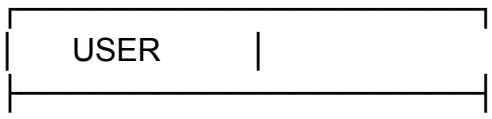

Use Case Diagram

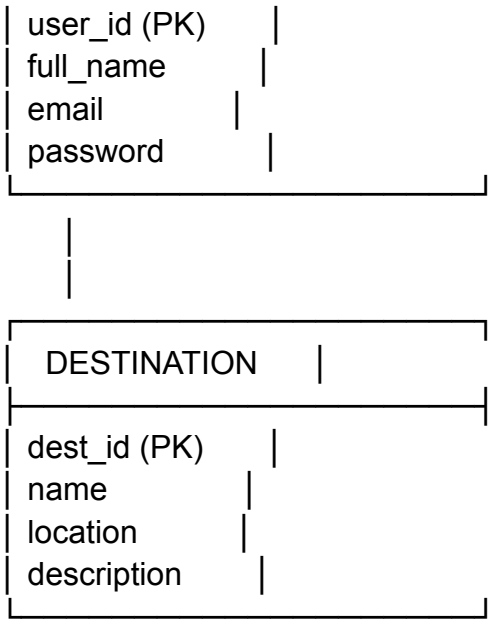

Use Case Descriptions:

- Register Account: User inputs full name, email address, and password to create a new account in the system.
- Login: User enters registered email and password to access the application dashboard.
- View Destinations: Once logged in, the user can browse through the list of featured travel destinations.
- Logout: User signs out of their account and is returned to the login screen.

Entity Relationship Diagram (ERD)

UI/UX AND IMPLEMENTATION

UI/UX Design

The application features a clean, minimal design with a nature-inspired color palette dominated by soft mint green and deep forest green, complemented by dark gray text for excellent readability. Key design elements include consistent branding across screens, clearly labeled input fields, bold green action buttons, and a scrollable destination list with distinct entries for each location.

Development Tools

- Android Studio – Primary Integrated Development Environment (IDE)
- XML – Used for designing user interface layouts
- Java / Kotlin – Used for writing application logic
- Android Emulator / Mobile Device – Used for running and testing the application

Technologies Used

Technology Purpose
Android SDK Provides libraries to build Android applications

XML Layout Defines the structure and appearance of screens
Basic User Authentication Logic Handles account creation and login validation
Local Data Storage Stores user credentials and destination information

Major Application Screens

Screen 1 — Login Screen: Displays the app logo, title, tagline, email and password fields, Login button, and Register link. This is the startup screen of the application.

Screen 2 — Create Account Screen: Contains input fields for Full Name, Email Address, and Password, a Register button, and a link back to the Login screen.

Screen 3 — Main Dashboard: Shows a welcome message with the user's name, Logout button, and a scrollable list of six destinations: Boracay Island, Chocolate Hills, Mayon Volcano, Banaue Rice Terraces, El Nido, and Siargao Island.

Feature Implementation

- Registration: Users complete the form and submit; data is stored locally and they are redirected to Login.
- Login: Credentials are verified; if correct, the dashboard loads with the destination list.
- Destination Display: Content loads automatically upon successful login.
- Logout: Clears the session and returns the user to the Login screen immediately.

TESTING AND EVALUATION

Test Case # Test Scenario Expected Result Status

TC-01 Open the application Login screen displays correctly

TC-02 Register with empty fields Prompts user to complete all fields

TC-03 Register with valid information Account created; redirects to Login

TC-04 Login with correct credentials Dashboard loads with welcome message

TC-05 Login with wrong password Error message appears; stays on Login

TC-06 View destination list All 6 destinations display correctly

TC-07 Scroll through list Smooth vertical scrolling

TC-08 Tap Logout Returns to Login screen

TC-09 Switch Register/Login screens Navigation works in both directions

TC-10 Keyboard appears Layout remains usable

Testing Results

User Evaluation

CONCLUSION AND RECOMMENDATIONS

Project Accomplishments

The NAVSPOT Travels and Tours mobile application was successfully developed as a functional project. Key accomplishments include:

- Complete user registration and login system
- Attractive, consistent interface across all screens
- Featured destinations displayed with descriptions and locations
- Smooth navigation flow between all application screens
- Proper logout and session management
- Valuable hands-on experience in mobile development and software testing

Problems Encountered

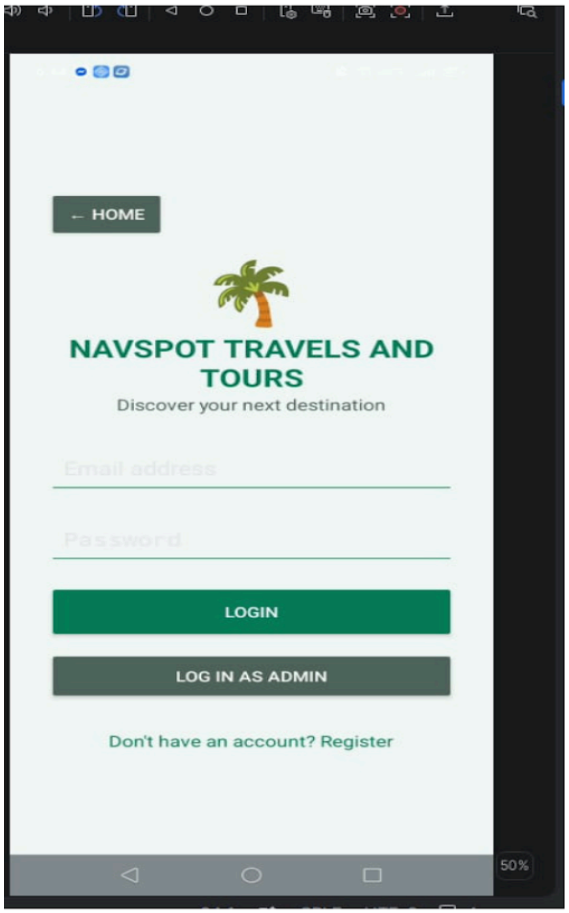

- Layout Consistency: Adjustments needed to ensure proper display across different screen sizes
- Data Persistence: User accounts are stored locally only for demonstration purposes
- Screen Navigation: Careful implementation required to ensure correct screen transitions
- Keyboard Overlap: Resolved by adjusting window settings on smaller devices

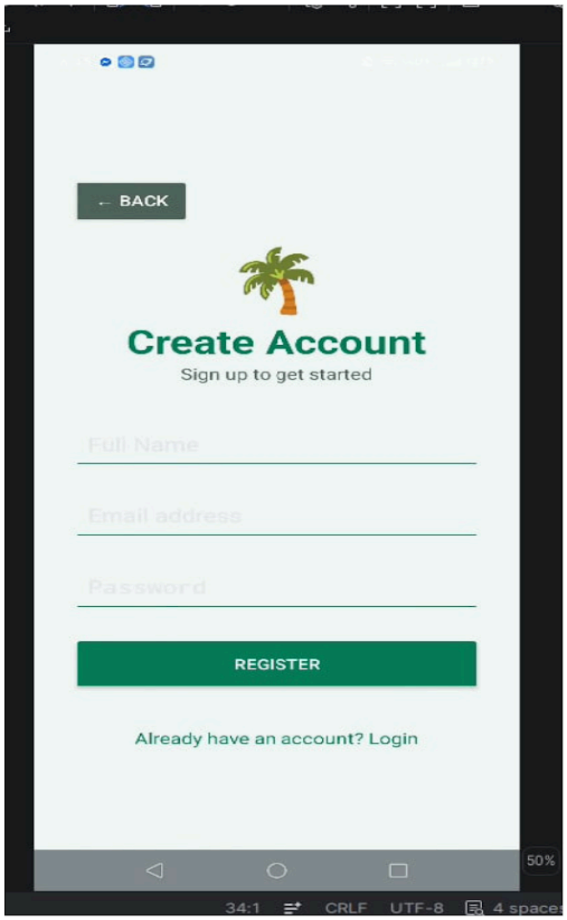

Recommendations and Future Improvements

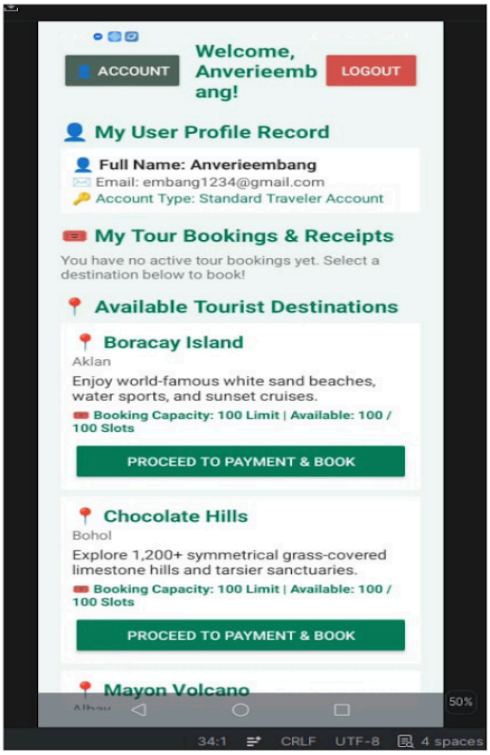

- Add more destinations with photographs
- Implement search and category filters
- Integrate cloud database for permanent accounts
- Add favorites/bookmark feature
- Include share functionality for social media
- Enable offline access to destination information
